ABSTRACT OF THE DISCLOSURE

The present invention provides aqueous pharmaceutical compositions containing a lipophilic therapeutic agent. In particular, the invention provides aqueous pharmaceutical compositions containing the compound 2,6-diisopropylphenol (propofol). Preferred compositions of the invention contain propofol in the presence of at least one block copolymer (for example, P188 or another poloxamer) and a polyethylene glycol (PEG). Compositions of the invention are preferably sterile or are readily sterilized (e.g., by autoclaving) and are suitable for parenteral administration to any animal, including humans.

The compositions are also chemically and physically stable over a wide range of

environmental conditions and for extended periods of time.
